Windows Security Benchmark [6.0.0.0]

The Windows Security Benchmark evaluates the security configuration of Windows operating systems, including both physical and virtual servers and workstations. It provides a consistent baseline for assessing and comparing security related policies, audit controls, account settings, and system configuration. The benchmark automatically adapts to the role of each machine - workstation, server, or domain controller to ensure accurate and relevant compliance results across diverse Windows environments.

SNMP Configuration

Simple Network Management Protocol (SNMP) is a UDP-based network protocol used by network monitoring and management systems. SNMP is protected by the use of passwords known as community strings and by allowing connections from specific hosts only. SNMP traps define the management hosts that will receive event messages from this machine.

User Rights Assignment

User Rights Assignment covers both the privileges and user rights that have been assigned to user accounts. Privileges determine the type of system operations that a user account can perform whereas account rights determine the type of logon that a user account can perform - for example logon as a service.
